

# صور ورشة العمل الخاصة بنظم الاستزراع السمكي الشائع في

مصر التي تم تنظيمها بالقسم 2015

| Types of fish species which raised in fish pond                                                                                                                                                                                          |                                                                                                                                                                                                                               |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Culture system                                                                                                                                                                                                                           | Monoculture system                                                                                                                                                                                                            |
| of more than one types of species in fish pond e.g. 5% carp, 12% silver carp, 35% on carp, 40% mullet and 10%                                                                                                                            | Culture of only one type of fish species in fish pond e.g. tilapia only or carp only or Mullet only                                                                                                                           |
| in pond only                                                                                                                                                                                                                             | Cement ponds, floating cages as well as earthen ponds (running water system for fish culture)                                                                                                                                 |
| ends mainly on utilization of the natural food in addition to the elementary food                                                                                                                                                        | Depends mainly on artificial food                                                                                                                                                                                             |
| increase of fish production due to utilization of natural food e.g. silver carp fed on phytoplankton, grass carp fed on zooplankton, grass carp fed on grasses & plants, common carp, Tilapia spp. and mullet spp. are omnivorous fishes | 1- easy to control of fish diseases (due to cultivation of one species only)<br>2- easy to control size and growth of cultured fish (after 2 or 6 month)<br>3- sorting of fish is easy due to cultivation of one species only |
| little cost of fish feeding due to the presence of natural food and some fish feed on excreta of other fish e.g. tilapia fed on excreta of common carp which fed on excreta of silver carp                                               |                                                                                                                                                                                                                               |
